## Cable Seal

## New Cable Penetrations Wall Inserts / System Covers

We have integrated sections designed to fracture under specified conditions into thermoset elastomers through the employment of a cutting-edge injection molding process. This technological advancement has significantly expanded the versatility and application range of our system enclosures and sealing solutions. To distinguish components that benefit from this novel, flexible linkage, they are now labeled with the designation “VG.” Additionally, our sealing solutions have been refined with the addition of a wall collar for single seals and dual collars for double sealing configurations, effectively eliminating the risk of water ingress via capillary action.

The cable penetration offerings from YTM Makina are comprehensively organized, highlighting the following product categories:

- seal packings / angular packings / front flanges / plug-in sleeve seal packings with bayonet mount
- system cover wall connections with bayonet mount
- seal inserts for seal packings
- single seal packings with factory-mounted wall connectivity

"... we don't just meet expectations, we redefine what's possible in pipe sealing excellence!"
